

You Design the Best Solution

As health care continues to change and staff responsibility becomes more complex, your facility deserves a communication system that can grow to meet your expanding needs. The Responder 5 VoIP Staff Terminal is made to order. This remarkable device replaces the static push button station with a dynamic touch screen interface that can be easily tailored to fit any hospital unit's specific requests. With a variety of changeable "soft" touch-points, multiple menu screens, and full-audio capability; each terminal is less of station replacement and more of a fully-functional nurse console for every room. This Staff Terminal station is the first to work the way you customize it to.

Your System, Your Choice

You asked, and Rauland delivered. This simple tool lets you find the staff you want, when you want, where ever they are on the unit. Best of all, each VoIP Staff Terminal is given your personal touch with multiple custom call types on 8 separate screens. It all adds up to 60 separate touch-points capable of performing over 900 possible unique facility-defined workflow processes. You set the preferences, the colors, the button sizes, the call-in tones, and the functions that will serve your staff in the best possible way.

Speed Dial With the push of a button you can instantly call the nurse console, another department, and even other VoIP Staff Terminals.

Alert Instantly notifies all staff assigned to a specific call process.

Notification Calls a particular department or staff member that their services are needed in the room. An example of this function would be setting an EKG notification to bring the machine into a patient room.

Reminder Setting a reminder button in a room alerts hospital staff to make routine visits by automatically calling a staff member's phone or pager, department, or the nurse console.

Toggle Create a button that can be turned on or off and tied back to a specific room function or alarm.

Sequential A series of buttons that ties together steps in a process. One example of this is the Bed Status process that connects the Environmental Services department to perform their cleaning duties, then contacts the next department when the room is cleaned to notify the room is available for a new patient.

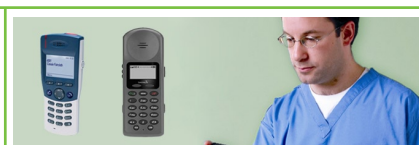

Scroll Down Menu Each VoIP Staff Terminal can be programmed with up to eight different menu screens with menu buttons that can be set to navigate between them. You can also set staff specific menus for nursing, patient needs, and Environmental Services. This ability allows employees to effortlessly find the unique touch-points specifically made for them.

CUSTOM STATION SOLUTIONS
